

Cat: AMP-101 Z Version:

AMP **One Step Amphetamine** Test Strip (Urine) **Package Insert** Format: Strip Effective Date: 2020-07

For professional *in vitro* diagnostic use only.

INTENDED USE

The AMP One Step Amphetamine Test Strip (Urine) is a lateral flow chromatographic immunoassay for the detection of Amphetamine in urine at a cut-off concentration of 1000 ng/mL. This test will detect other related compounds, please refer to the Analytical Specificity table in this package insert

This assay provides only a qualitative, preliminary analytical test result. A more specific alternate chemical method must be used in order to obtain a confirmed analytical result. Gas chromatography/mass spectrometry (GC/MS) is the preferred confirmatory method. Clinical consideration and professional judgment should be applied to any drug of abuse test result, particularly when preliminary positive results are used.

INTRODUCTION

Amphetamine is a Schedule II controlled substance available by presecription (Dexedrine®) and is also available on the illicit market. Amphetamines are a class of potent sympathomimetic agents with therapeutic applications. They are chemically related to the human body's natural catecholamines: epinephrine and norepinephrine. Acute higher doses lead to enhanced stimulation of the central nervous system and induce euphoria, alertness, reduced appetite, and a sense of increased energy and power. Cardiovascular responses to Amphetamines include increased blood pressure and cardiac arrhythmias. More acute responses produce anxiety, paranoia, hallucinations, and psychotic behavior. The effects of Amphetamines generally last 2-4 hours following use, and the drug has a half-life of 4-24 hours in the body. About 30% of Amphetamines are excreted in the urine in unchanged form, with the remainder as hydroxylated and deaminated derivatives.

The AMP One Step Amphetamine Test Strip (Urine) is a rapid urine screening test that can be performed without the use of an instrument. The test utilizes a monoclonal antibody to selectively detect elevated levels of Amphetamines in urine. The One Step Amphetamine Rapid Test (Urine) yields a positive result when Amphetamines in urine exceed 1,000 ng/mL.

PRINCIPLE

The AMP One Step Amphetamine Test Strip (Urine) is a rapid chromato graphic immunoassay based on the principle of competitive binding. Drugs which may be present in the urine specimen compete against the drug conjugate for binding sites on the antibody.

During testing, a urine specimen migrates upward by capillary action. Amphetamine, if present in the urine specimen below 1.000 ng/mL, will not saturate the binding sites of the antibody coated particles in the Test Strip. The antibody coated particles will then be captured by immobilized Amphetamine conjugate and a visible colored line will show up in the test line region. The colored line will not form in the test line region if the Amphetamine level exceeds 1,000 ng/mL because it will saturate all the binding sites of anti-Amphetamine antibodies.

A drug-positive urine specimen will not generate a colored line in the test line region because of drug competition, while a drug-negative urine specimen or a specimen containing a drug concentration less than the cut-off will generate a line in the test line region. To serve as a procedural control, a colored line will always appear at the control line region indicating that proper volume of specimen has been added and membrane wicking has occurred.

REAGENTS

The test contains drug-bovine protein antigen conjugate on the membrane and the conjugate pad of each test contains monoclonal antidrug antibody.

KIT COMPONENTS

Individually packed test strips Package insert	Each strip contains colored conjugates and reactive reagents pre-spreaded at the corresponding regions. For operation instruction.
MATERIALS REQUIRED B	UT NOT PROVIDED
Specimen collection	For specimens collection use.

container

Timer

For timing use.

PRECAUTIONS

- For professional *in vitro* diagnostic use only.
- Do not use after expiration date indicated on the package. Do not use the test if its foil pouch is damaged. Do not reuse tests.
- This kit contains products of animal origin. Certified knowledge of the origin and/or sanitary state of the animals does not totally guarantee the absence of transmissible pathogenic agents. It is therefore, recommended that these products be treated as potentially infectious, and handled observing the usual safety precautions (do not ingest or inhale).
- Avoid cross-contamination of specimens by using a new specimen collection container for each specimen obtained.
- · Read the entire procedure carefully prior to performing any tests.
- Do not eat, drink or smoke in the area where the specimens and kits are handled. Handle all specimens as if they contain infectious agents. Observe established precautions against microbiological hazards throughout the procedure and follow the standard procedures for proper disposal of specimens. Wear protective clothing such as laboratory coats, disposable gloves and eve protection when specimens are assayed.
- Humidity and temperature can adversely affect results.
- The used testing materials should be discarded in accordance with local, state and/or federal regulations.

STORAGE AND STABILITY

- The kit should be stored at 2-30°C until the expiry date printed on the sealed pouch.
- The test must remain in the sealed pouch until use.
- Do not freeze.
- · Cares should be taken to protect components in this kit from contamination. Do not use if there is evidence of microbial contamination or precipitation. Biological contamination of dispensing equipments, containers or reagents can lead to false results.

SPECIMEN COLLECTION AND STORAGE

- The urine specimen must be collected in a clean and dry container. Urine collected at any time of the day may be used. Urine specimens exhibiting visible particles should be centrifuged, filtered, or allowed to settle to obtain clear specimen for testing.
- Collected urine specimens must be put in clear and dry containers. Ensure that a sufficient quantity of the specimen is collected to allow submerging the dipping area of the strip.
- · Perform the testing immediately after the specimen collection. Do not leave the specimens at room temperature for prolonged periods. Specimens may be stored at 2-8°C for up to 48 hours. For long term storage, specimens should be kept below -20°C.
- · Bring specimens to room temperature prior to testing. Frozen specimens must be completely thawed and mixed well prior to testing. Avoid repeated freezing and thawing of specimens.

· Pack the specimens in compliance with applicable regulations for transportation of etiological agents, in case they need to be shipped. PROCEDURE

Bring tests, specimens and/or controls to room temperature (15-30°C) before use.

- 1. Remove the test from its sealed pouch and use it as soon as possible. To obtain a best result, the assay should be performed within one hour.
- 2. Hold the strip at the handle with the product name imprints. Do not touch the membrane part of the strip to avoid contamination.
- 3. Dip the test strip vertically in the urine specimen for at least 8-**10 seconds.** Do not pass the maximum line (MAX) on the test strip when immersing the strip.

As the test begins to work, you will see color move across the membrane.

4. Take the strip out of the specimen afterwards and place it on a nonabsorbent flat surface. Start the timer and wait for the colored line(s) to appear. The result should be read at 5 minutes. Do not interpret the result after 10 minutes.

INTERPRETATION OF RESULTS

POSITIVE RESULT:

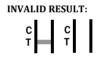

Only one colored band appears in the control region (C). No apparent colored band appears in the test region (T).

Two colored bands appear on the membrane. One band appears in the control region (C) and another band appears in the test region (T).

Control band fails to appear. Results from any test which has not produced a control band at the specified reading time must be disgarded. Please review the procedure and repeat with a new test. If the problem persists, discontinue using the kit immediately and contact your local distributor.

NOTE:

- 1. The intensity of the color in test region (T) may vary depending on the concentration of aimed substances present in the specimen. Therefore, any shade of color in the test region should be considered negative. Besides, the concentration level can not be determined by this qualitative test.
- 2. Insufficient specimen volume, incorrect operation procedure, or performing expired tests are the most likely reasons for control band failure.

OUALITY CONTROL

- Internal procedural controls are included in the test. A colored band appearing in the control region (C) is considered an internal positive procedural control. It confirms sufficient specimen volume and correct procedural technique.
- External controls are not supplied with this kit. It is recommended that positive and negative controls be tested as a good laboratory practice to confirm the test procedure and to verify proper test performance.

LIMITATIONS OF THE TEST

- 1. The AMP One Step Amphetamine Test Strip (Urine) provides only a qualitative, preliminary analytical result, A secondary analytical method must be used to obtain a confirmed result. Gas chromatography/mass spectrometry (GC/MS) is the preferred confirmatory method. 1,2
- 2. It is possible that technical or procedural errors, as well as other interfering substances in the urine specimen may cause erroneous results.

- Adulterants, such as bleach and/or alum, in urine specimens may produce erroneous results regardless of the analytical method used. If adulteration is suspected, the test should be repeated with another urine specimen.
- 4. A positive result indicates presence of the drug or its metabolites but does not indicate level of intoxication, administration route or concentration in urine.
- 5. A negative result may not necessarily indicate drug-free urine. Negative results can be obtained when drug is present but below the cut-off level of the test.
- 6. Test does not distinguish between drugs of abuse and certain medications.

PERFORMANCE CHARACTERISTICS

A. Accuracy

118 clinical urine specimens were analyzed by GC-MS and by the AMP One Step Amphetamine Test Strip (Urine).Each test was performed by three operators. Samples were divided by concentration into five categories: negative, less than half the cutoff, near cutoff negative, near cutoff positive, and high positive. Results were as follows:

M	ethod	GC/MS							
Ampl	AMP One Step netamine st Strip	Ne g.	Neg. (< – 50% cutoff)	Near cutoff neg. (-50% cutoff to cutoff)	Near cutoff pos. (cutoff to +50% cutoff)	Pos. (> +50 % cutoff)	% agree ment with GC/MS		
АМР	Positive	0	0	1	15	22	97.37 %		
1000	Negative	51	14	14	1	0	98.75 %		

B. Precision

A study was conducted at three physician offices for Amphetamine (1000 ng/mL)by professional operators using three different lots of product to demonstrate the within run, between run and between operator precision. An identical panel of coded specimens, containing drugs at the concentration of \pm 50% and \pm 25% cut-off level, was labeled as a blind and tested at each site. The results are given below:

	n	Site A		Sit	e B	Site C	
Drug Conc.	per site	N	Р	N	Р	N	Р
Negative	10	10	0	10	0	10	0
-50% Cut-off	10	10	0	10	0	10	0
-25% Cut-off	10	9	1	9	1	10	0
+25% Cut-off	10	1	9	0	10	1	9
+50% Cut-off	10	0	10	0	10	0	10

C. Effect of Urinary Specific Gravity

Fifteen (15) urine samples of normal, high, and low specific gravity ranges (1.000-1.037) were spiked with drugs at 50% below and 50% above cut-off levels respectively. The AMP One Step Amphetamine Test Strip (Urine) was tested in duplicate using fifteen drug free urine and spiked urine samples. The results demonstrate that varying ranges of urinary specific gravity do not affect the test results.

D. Effect of Urinary pH

The pH of an aliquoted negative urine pool was adjusted to a pH range of 5 to 9 in 1 pH unit increments and spiked with drugs at 50% below and 50% above cut-off levels. The spiked, pH adjusted urine was tested with the AMP One Step Amphetamine Test Strip (Urine). The results demonstrate that varying ranges of pH do not interfere with the performance of the test. **E. Cross-Reactivity**

The following tables list the concentrations of compounds (ng/mL) above which the AMP One Step Amphetamine Test Strip (Urine) identified positive results at 5 minutes.

Amphetamine related Compound	Concentration (ng/mL <u>)</u>
l-Amphetamine	50000
d,l-Amphetamine	3000
d-Amphetamine	1000
(\pm) 3,4-Methylenedioxy amphetamine(MDA)	2000
Phentermine	3000

F. Non Cross-Reacting Compounds

The following compounds yielded negative results up to a concentration of 100 µg/mL:

4-Acetamidophenol	Gatifloxacin	Penfluridol
Acetaminophen	Gemfibrozil	Penicillin G potassium salt
Acetylsalicylic Acid Albumin Amoxicillin Ampicillin trihydrate Aspartame Atropine Baclofen Benzoic Acid Berberine Chloride	Gentisic Acid Gliclazide Glipizide Glyburide Guaiacol Guaifenesin Hemoglobin Hydralazine HCl Hydrochlorothiazide	Penicillin G sodium salt Perphenazine Phenacetin Phenelzine Sulfate Phenothiazine 2-Phenylethylamine Pioglitazone Piracetam Pravastatin sodium
Hydrate	Hydrocortisone	Prednisone
Bilirubin	Ibuprofen	Procaine
Caffeine Cephalexin Cephradine Chloral hydrate Chloramphenicol	Isoprenaline Ketoconazole Ketoprofen Lamotrigine L-Ascorbic acid	Promethazine hydrochlorine 6-Propyl-2-thiouracil Pyridoxine Pyrilamine Maleate Pyrogallic
Chlorpheniramine Maleate	Levofloxacin	Quetiapine Fumarate
Chlorpromazine Cholesterol Ciprofloxacin hydrate Clarithromycin Clonidine solution Creatinine D(-)-Norgestrel d,l-Propranolol Deoxycorticosterone	Lidocaine Lidocaine Monohydrate Lisinopril Dihydrate Lithium carbonate Loperamide Loratadine L-Thyroxine sodium Maprotiline Meprobamate	Quinine Quinolinic acid R,R(-)-Pseudoephedrin Ranitidine base Ranitidine Riboflavin Rifampicin Risperidone Salicylic acid
Dextromethorphan solution	Minocycline	Sertraline HCl
Diciofenac	Mosapride Citrate	Simvastatin
Diflunisal	Nalidixic acid	Sodium 2- Propylvalerate
Digoxin	Naloxone HCl	Sulfamethazine
4-Dimethyl- aminoantipyrine	Naltrexone HCl	Sulindac
Diphenhydramine 5,5-Diphenylhydantoin D-Lactose monohydrate	Naproxen Nicotinamide Nicotinic acid	Tetracycline Tetrahydrozoline Theophylline
D-Leucyl-L-tyrosine Hydrate	Nifedipine	Thiamine
Dopamine Droperidol Enalapril Maleate Erythromycin	Nimodipine Norethisterone Acetate Norfloxacin Nicotinic Noscapine	Thioridazine solution Tolbutamide Topiramate 2,4,7-Triamino-6- Phenylpteridine

Estradiol	(±)-Octopamine	Trimethoprim
Estrone	Ofloxacin	Tryptamine
Ethyl 4-aminobenzoate	Olanzapine	Tyramine
Fluoxetine	Oxalic acid, anhydrous	Uric acid
Fotemustine	Oxolinic acid	(±)-Verapamil
Furosemide	Paliperidone	Vitamin B1
Gabapentin	Pantoprazole sodium	Zomepirac
