

# **OXY**

# One Step Oxycodone Test Device (Urine) Package Insert

Cat: OXY-102 Format: Device

**Version:** Z **Effective Date:** 2020-07

For professional in vitro diagnostic use only.

### **INTENDED USE**

The OXY One Step Oxycodone Test Device (Urine) is a lateral flow chromatographic immunoassay for the detection of Oxycodone in urine at a cut-off concentration of 100 ng/mL. This test will detect other related compounds, please refer to the Analytical Specificity table in this package insert.

This assay provides only a qualitative, preliminary analytical test result. A more specific alternate chemical method must be used in order to obtain a confirmed analytical result. Gas chromatography/mass spectrometry (GC/MS) is the preferred confirmatory method. Clinical consideration and professional judgment should be applied to any drug of abuse test result, particularly when preliminary positive results are used.

## INTRODUCTION

Oxycodone is a semi-synthetic opioid with a structural similarity to codeine. The drugis manufactured by modiying the baine, an alkaloid found in the opium poppy.Oxycodone, like all opiate agonists, provides pain relief by acting on opioid receptors in the spinal cord, brain, and possibly directly in the affected tissues. Oxycodone is prescribed for the relief of moderate to high pain under the well-known pharmaceutical trade names of OxyContin®, Tylox®, Percodan® and Percocet®. While Tylox, Percodan and Percocet contain only small doses of oxycodone hydrochloride combined with other analgesics such as acetaminophen or aspirin, OxyContin consists solely of oxycodone hydrochloride in a time-release form .

Oxycodone is known to metabolize by demethylation into oxymorphone and noroxycodone. In a 24-hour Urine, 33-61% of a single, 5mg oral dose is excreted with the primary constituents being unchanged drug (13-19%), conjugated drug (7-29%) and conjugated oxymorphone (13-149%),The window of detection for oxycodone in urine is expected to be similar to that of other opioids such as morphine.

The OXY One Step Oxycodone Test Device (Urine) yields a positive result when the oxycodone level in urine exceeds 100ng/mL.

### PRINCIPLE

The OXY One Step Oxycodone Test Device (Urine) is an immunoassay based on the principle of competitive binding. Drugs that may be present in the urine specimen compete against the drug conjugate for binding sites on the antibody.

During testing, a urine specimen migrates upward by capillary action. Oxycodone, if present in the urine specimen below the cut-off level, will not saturate the binding sites of the antibody in the test. The antibody coated particles will then be captured by immobilized Oxycodone-protein conjugate and a visible colored line will show up in the test line region. The colored line will not form in the test line region if the Oxycodone level exceeds the cut-off level, because it will saturate all the binding sites of anti-Oxycodone antibodies.

A drug-positive urine specimen will not generate a colored line in the test line region because of drug competition, while a drug-negative urine specimen or a specimen containing a drug concentration less than the cut-off will generate a line in the test line region. To serve as a procedural control, a colored line will always appear at the control line region

indicating that proper volume of specimen has been added and membrane wicking has occurred.

## REAGENTS

The test contains drug-bovine protein antigen conjugate on the membrane and the conjugate pad of each test contains monoclonal antidrug antibody.

# KIT COMPONENTS

**Individually packed Test** 

Devices

Each Device contains a strip with colored conjugates and reactive reagents pre-spreaded at the corresponding regions.

Package insert For operation instruction.

## MATERIALS REQUIRED BUT NOT PROVIDED

**Specimen collection** For specimens collection use.

container

**Timer** For timing use.

### PRECAUTIONS

- For professional in vitro diagnostic use only.
- Do not use after expiration date indicated on the package. Do not use the test if its foil pouch is damaged. Do not reuse tests.
- This kit contains products of animal origin. Certified knowledge of the
  origin and/or sanitary state of the animals does not totally guarantee
  the absence of transmissible pathogenic agents. It is therefore,
  recommended that these products be treated as potentially infectious,
  and handled observing the usual safety precautions (do not ingest or
  inhale).
- Avoid cross-contamination of specimens by using a new specimen collection container for each specimen obtained.
- Read the entire procedure carefully prior to performing any tests.
- Do not eat, drink or smoke in the area where the specimens and kits are handled. Handle all specimens as if they contain infectious agents. Observe established precautions against microbiological hazards throughout the procedure and follow the standard procedures for proper disposal of specimens. Wear protective clothing such as laboratory coats, disposable gloves and eye protection when specimens are assayed.
- · Humidity and temperature can adversely affect results.
- The used testing materials should be discarded in accordance with local, state and/or federal regulations.

### STORAGE AND STABILITY

- The kit should be stored at 2-30°C until the expiry date printed on the sealed pouch.
- The test must remain in the sealed pouch until use.
- Do not freeze.
- Cares should be taken to protect components in this kit from contamination. Do not use if there is evidence of microbial contamination or precipitation. Biological contamination of dispensing equipment, containers or reagents can lead to false results.

# SPECIMEN COLLECTION AND STORAGE

- The urine specimen must be collected in a clean and dry container.
   Urine collected at any time of the day may be used. Urine specimens exhibiting visible particles should be centrifuged, filtered, or allowed to settle to obtain clear specimen for testing.
- Collected urine specimens must be put in clear and dry containers.
- Perform the testing immediately after the specimen collection. Do not leave the specimens at room temperature for prolonged periods.
   Specimens may be stored at 2-8°C for up to 48 hours. For long term storage, specimens should be kept below -20°C.
- Bring specimens to room temperature prior to testing. Frozen

- specimens must be completely thawed and mixed well prior to testing. Avoid repeated freezing and thawing of specimens.
- Pack the specimens in compliance with applicable regulations for transportation of etiological agents, in case they need to be shipped.

#### PROCEDUR

Bring tests, specimens and/or controls to room temperature (15- $30^{\circ}$ C) before use.

- Bring the pouch to room temperature before opening it. Remove the test device from the sealed pouch and use it as soon as possible.
- 2. Place the test device on a clean and level surface. Hold the dropper vertically and **transfer 3 full drops of urine** (approx.  $100 \mu L$ ) to the specimen well (S) of the test device, and then start the timer. Avoid trapping air bubbles in the specimen well (S).
- 3. Wait for the colored line(s) to appear. **Read results at 5 minutes.** Do not interpret the result after 10 minutes.

### INTERPRETATION OF RESULTS

### POSITIVE RESULT:

Only one colored band appears in the control region (C). No apparent colored band appears in the test region (T).

# **NEGATIVE RESULT:**

Two colored bands appear on the membrane. One band appears in the control region (C) and another band appears in the test region (T).

# INVALID RESULT:

Control band fails to appear. Results from any test which has not produced a control band at the specified reading time must be discarded. Please review the procedure and repeat with a new test. If the problem persists, discontinue using the kit immediately and contact your local distributor.

### NOTE:

- The intensity of the color in test region (T) may vary depending on the concentration of aimed substances present in the specimen. Therefore, any shade of color in the test region should be considered negative. Besides, the concentration level can not be determined by this qualitative test.
- Insufficient specimen volume, incorrect operation procedure, or performing expired tests are the most likely reasons for control band failure.

# QUALITY CONTROL

- Internal procedural controls are included in the test. A colored band appearing in the control region (C) is considered an internal positive procedural control. It confirms sufficient specimen volume and correct procedural technique.
- External controls are not supplied with this kit. It is recommended
  that positive and negative controls be tested as a good laboratory
  practice to confirm the test procedure and to verify proper test
  performance.

# LIMITATIONS OF THE TEST

- 1. The OXY One Step Oxycodone Test Device (Urine) provides only a qualitative, preliminary analytical result. A secondary analytical method must be used to obtain a confirmed result. Gas chromatography/mass spectrometry (GC/MS) is the preferred confirmatory method.<sup>2,3</sup>
- It is possible that technical or procedural errors, as well as other interfering substances in the urine specimen may cause erroneous results.
- 3. Adulterants, such as bleach and/or alum, in urine specimens may produce erroneous results regardless of the analytical method used. If adulteration is suspected, the test should be repeated with another

- urine specimen.
- 4. A positive result indicates presence of the drug or its metabolites but does not indicate level of intoxication, administration route or concentration in urine.
- 5. A negative result may not necessarily indicate drug-free urine. Negative results can be obtained when drug is present but below the cut-off level of the test.
- 6. Test does not distinguish between drugs of abuse and certain medications.

# PERFORMANCE CHARACTERISTICS

# A. Accuracy

129 clinical urine specimens were analyzed by GC-MS and the OXY One Step Oxycodone Test Device (Urine). Each test was performed by three operators. Samples were divided by concentration into five categories: negative, less than half the cutoff, near cutoff negative, near cutoff positive, and high positive. Results were as follows:

M	lethod	GC/MS					
Step C	OXY One Oxycodone t Device	Neg.	Neg. (< – 50% cutoff)	Near cutoff neg. (-50% cutoff to cutoff)	Near cutoff pos. (cutoff to +50% cutoff)	Pos. (> +50% cutoff)	% agree ment with GC/MS
OXY	Negative	21	23	25	1	0	97.2
100	Positive	0	0	2	30	27	98.3

### **B.** Precision

A study was conducted at three physician offices for Oxycodone (100 ng/mL)by professional operators using three different lots of product to demonstrate the within run, between run and between operator precision.An identical panel of coded specimens, containing drugs at the concentration of  $\pm$  50% and  $\pm$  25% cut-off level, was labeled as a blind and tested at each site. The results are given below:

Drug Conc.	n	Site A		Site B		Site C	
Di ug Conc.	per site	-	+	-	+	-	+
Negative	10	10	0	10	0	10	0
-50% Cut-off	10	10	0	10	0	10	0
-25% Cut-off	10	9	1	9	1	10	0
+25% Cut-off	10	0	10	0	10	1	9
+50% Cut-off	10	0	10	0	10	0	10

# C. Effect of Urinary Specific Gravity

Fifteen (15) urine samples of normal, high, and low specific gravity ranges (1.000-1.037) were spiked with drugs at 50% below and 50% above cut-off levels respectively. The OXY One Step Oxycodone Test Device (Urine) was tested in duplicate using fifteen drug free urine and spiked urine samples. The results demonstrate that varying ranges of urinary specific gravity do not affect the test results.

# D. Effect of Urinary pH

The pH of an aliquoted negative urine pool was adjusted to a pH range of 5 to 9 in 1 pH unit increments and spiked with drugs at 50% below and 50% above cut-off levels. The spiked, pH adjusted urine was tested with the OXY One Step Oxycodone Test Device (Urine). The results demonstrate that varying ranges of pH do not interfere with the performance of the test.

# **E.Cross-Reactivity**

The following tables list the concentrations of compounds (ng/mL) above which the OXY One Step Oxycodone Test Device (Urine) identified positive results at 5 minutes.

Oxycodone related Compound	Concentration (ng/mL)		
Codeine	50000		
Dihydrocodeine	20000		
Ethylmorphine	100000		
Hydrocodone	6250		
Hydromorphone	50000		
Oxymorphone	200		
Thebaine	50000		

### F.Non.Cross-Reactivity Compounds

Erythromycin

The following compounds yielded negative results up to a concentration of  $100 \mu g/mL$ :

of 100 μg/mL:		
4-Acetamidophenol	Gatifloxacin	Penfluridol
Acetaminophen	Gemfibrozil	Penicillin G potassium salt
Acetylsalicylic Acid Albumin Amoxicillin Ampicillin Ampicillin trihydrate Aspartame Atropine Baclofen Benzoic Acid Berberine Chloride	Gentisic Acid Gliclazide Glipizide Glyburide Guaiacol Guaifenesin Hemoglobin Hydralazine HCl Hydrochlorothiazide	Penicillin G sodium salt Perphenazine Phenacetin Phenelzine Sulfate Phenothiazine 2-Phenylethylamine Pioglitazone Piracetam Pravastatin sodium
Hydrate	Hydrocortisone	Prednisone
Bilirubin	Ibuprofen	Procaine
Caffeine	Isoprenaline	Promethazine hydrochlorine
Cephalexin Cephradine Chloral hydrate Chloramphenicol	Ketoconazole Ketoprofen Lamotrigine L-Ascorbic acid	6-Propyl-2-thiouracil Pyridoxine Pyrilamine Maleate Pyrogallic
Chlorpheniramine Maleate	Levofloxacin	Quetiapine Fumarate
Chlorpromazine Cholesterol Ciprofloxacin hydrate Clarithromycin Clonidine solution Creatinine D(-)-Norgestrel d,l-Propranolol Deoxycorticosterone	Lidocaine Lidocaine Monohydrate Lisinopril Dihydrate Lithium carbonate Loperamide Loratadine L-Thyroxine sodium Maprotiline Meprobamate	Quinine Quinolinic acid R,R(-)-Pseudoephedrin Ranitidine base Ranitidine Riboflavin Rifampicin Risperidone Salicylic acid
Dextromethorphan solution	Minocycline	Sertraline HCl
Diciofenac Diflunisal	Mosapride Citrate Nalidixic acid	Simvastatin Sodium 2- Propylvalerate
Digoxin 4-Dimethyl-	Naloxone HCl	Sulfamethazine
aminoantipyrine	Naltrexone HCl	Sulindac
Diphenhydramine 5,5-Diphenylhydantoin D-Lactose monohydrate	Naproxen Nicotinamide Nicotinic acid	Tetracycline Tetrahydrozoline Theophylline
D-Leucyl-L-tyrosine Hydrate	Nifedipine	Thiamine
Dopamine Droperidol Enalapril Maleate	Nimodipine Norethisterone Acetate Norfloxacin Nicotinic	Thioridazine solution Tolbutamide Topiramate

Noscapine

2,4,7-Triamino-6-

Phenylpteridine

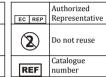

Estradiol	(±)-Octopamine	Trimethoprim
Estrone	Ofloxacin	Tryptamine
Ethyl 4-aminobenzoate	Olanzapine	Tyramine
Fluoxetine	Oxalic acid, anhydrous	Uric acid
Fotemustine	Oxolinic acid	(±)-Verapamil
Furosemide	Paliperidone	Vitamin B1
Gabapentin	Pantoprazole sodium	Zomepirac
